

# What Does a Healthy Home Look Like?

An energy-efficient home is a healthy home! If you want to make your house efficient and healthy, make sure it has these features.

## Green Building Materials

Using green building practices and materials keeps toxic building materials out of your home and prevents off-gassing.

## Insulation

Well-insulated homes maintain a safe and comfortable temperature throughout, keeping your family comfortable and saving energy.

## Tight Building Envelope

A tight building envelope means there are no uncomfortable drafts and eliminates the risk of unwanted air and moisture that lead to mold or mildew.

## Ventilation

Proper ventilation removes the harmful byproducts of daily life and replaces them with clean comfortable filtered air.

## Fire, Smoke & CO2 Detection

Detection systems are essential to monitor hazards and warn you immediately if danger is present.

## Solar, Batteries, & Generators

Solar PV systems with backup batteries and generators allow you to keep essential equipment on during a power outage.
